

All the work done for this class was for the purpose of improving Shin ai' Rewritten through VFX and Shader Work.

The Water Shader

This was the first project I worked on. I started by following a tutorial to create a simple water shader.

 Create COMPLEX STYLIZED WATER Material in Unreal Engine 5

This was the tutorial that I followed. I first completed it as is for understanding and after that I then edited the asset to have it match our artstyle better.

Then I went further and made a material to act as a waterfall and had those follow along a pcg spline overtop of the water shader to create the effect I was aiming for.

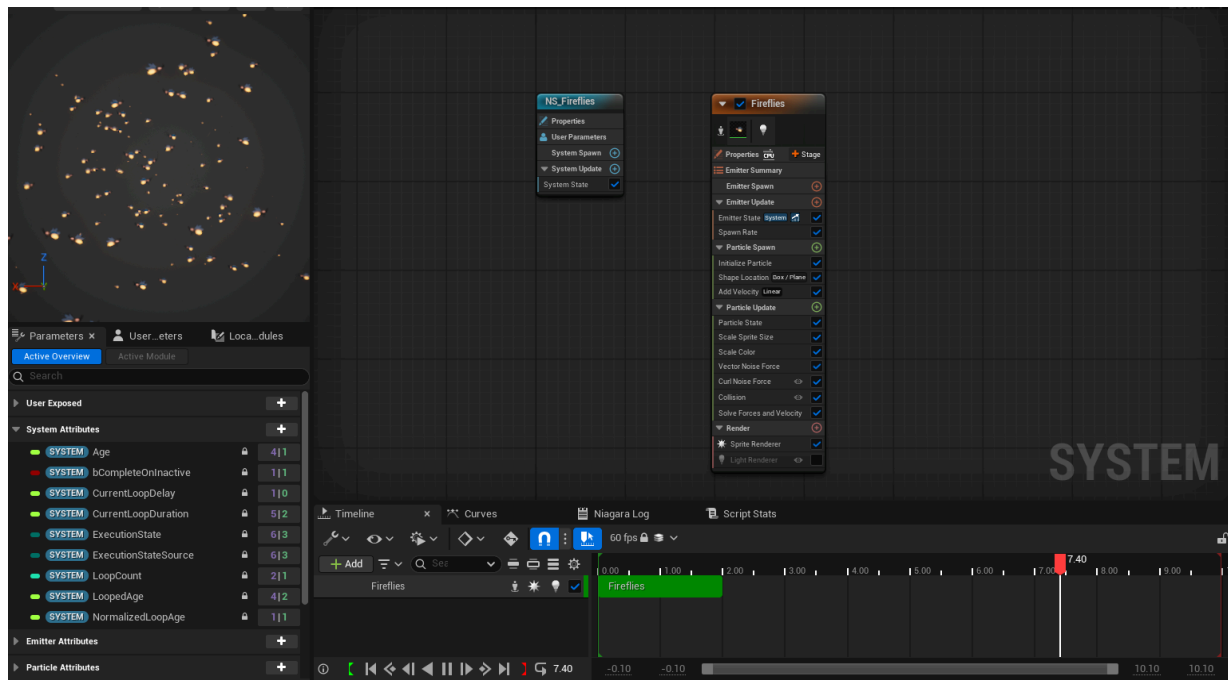

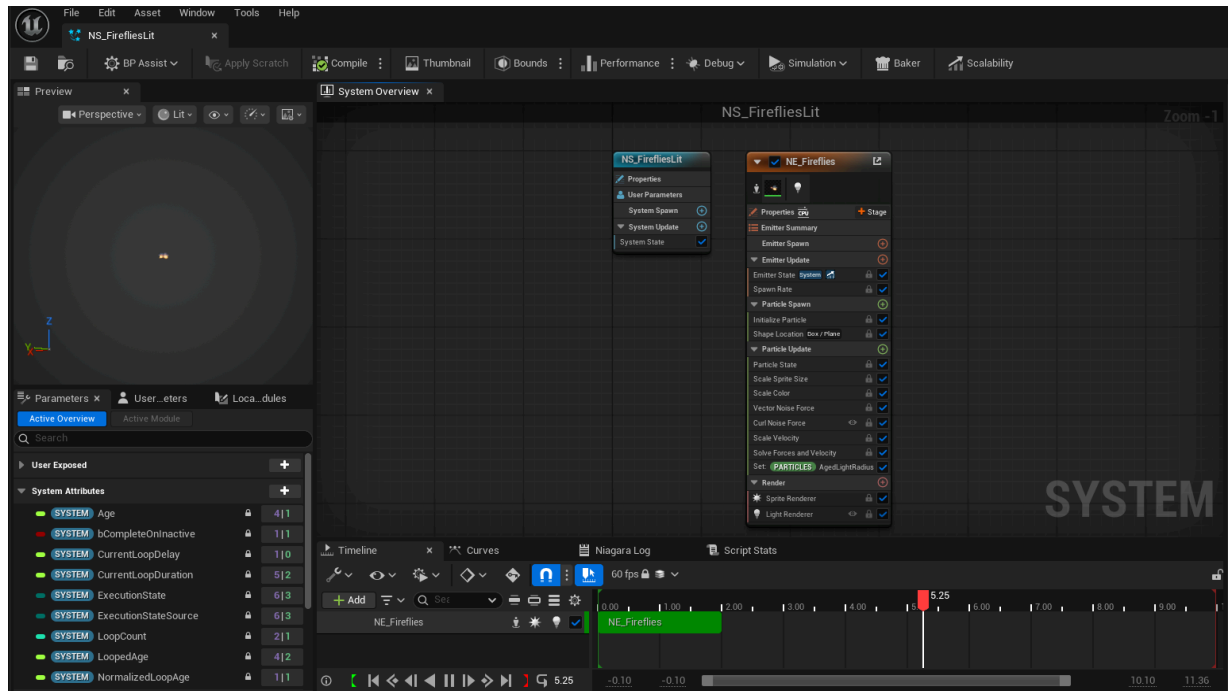

VFX Work - Fireflies

So in this section I created two particles that do almost the same thing but to help performance one has light attached to them and the other does not.

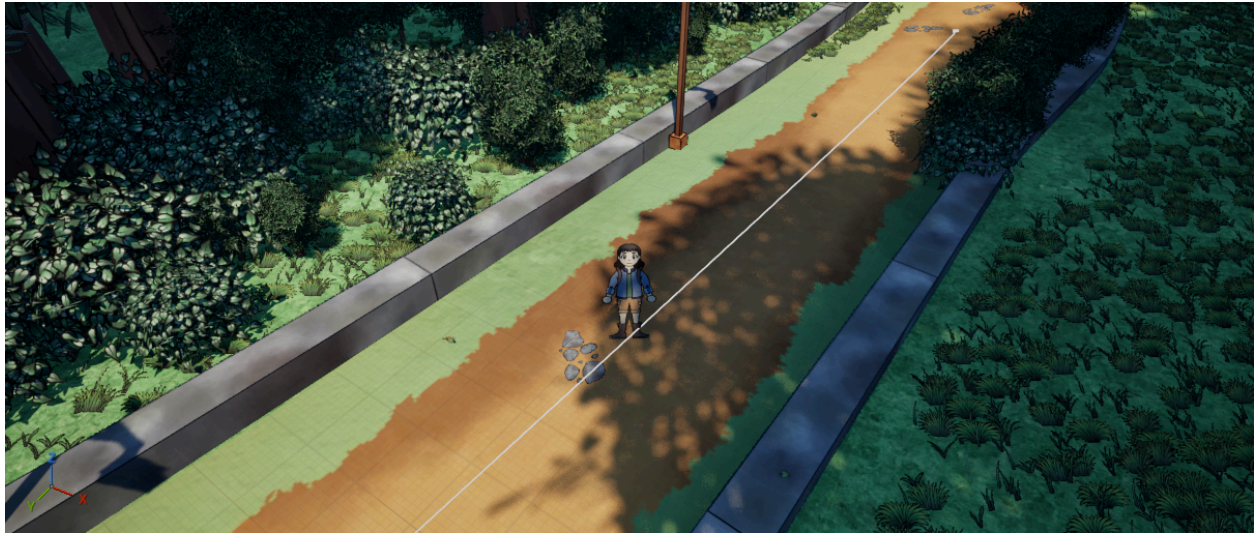

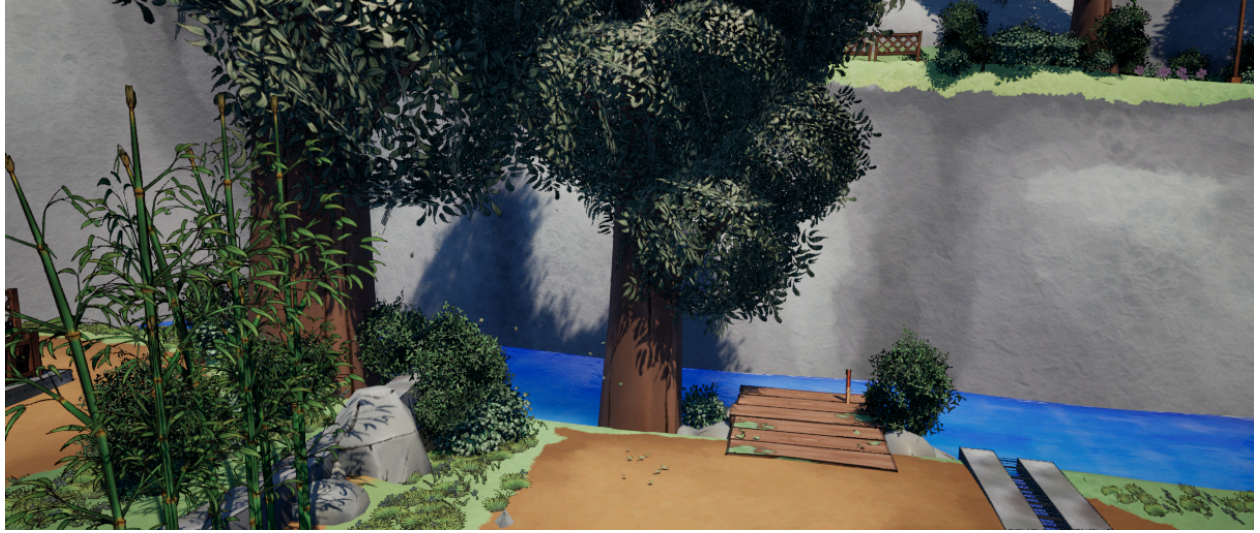

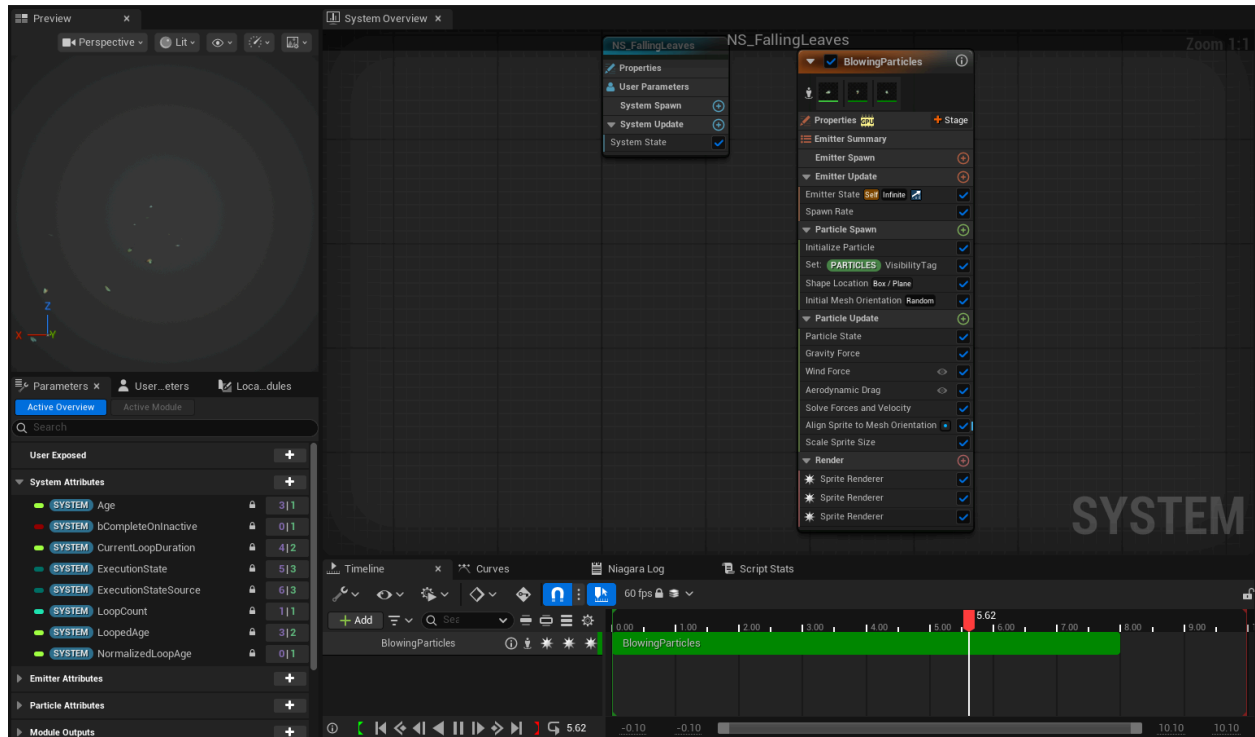

The Fireflies near the ground clearly are emanating light and the ones higher in the air just have an emissive texture.

VFX Work - Leaves

This vfx was a particle effect for a variety of falling leaves.

Both of these effects were designed to be very simple, subtle effects to add more movement and ambience to the environment without being overwhelming.
